

Digital wallets

Creating a wallet platform which provides users with the ability to create digital wallets for transferring and holding crypto assets on blockchains like bitcoin, ripple and Ethereum.

Problem Statement

What exactly are we working on

- There exist no free wallets that provide the ability to trade over different blockchains
- Existing wallets donot perform AML checks
- There is no platform that provides an environment where users participating are not annonymous.

Crypto wallets

A digital wallet enabling the functionality of creating a wallet and dealing with crypto assets.

On our platform, users can:
Interact with the blockchain and their
corresponding digital assets.

Getting Balance
of assets

Transferring
assets

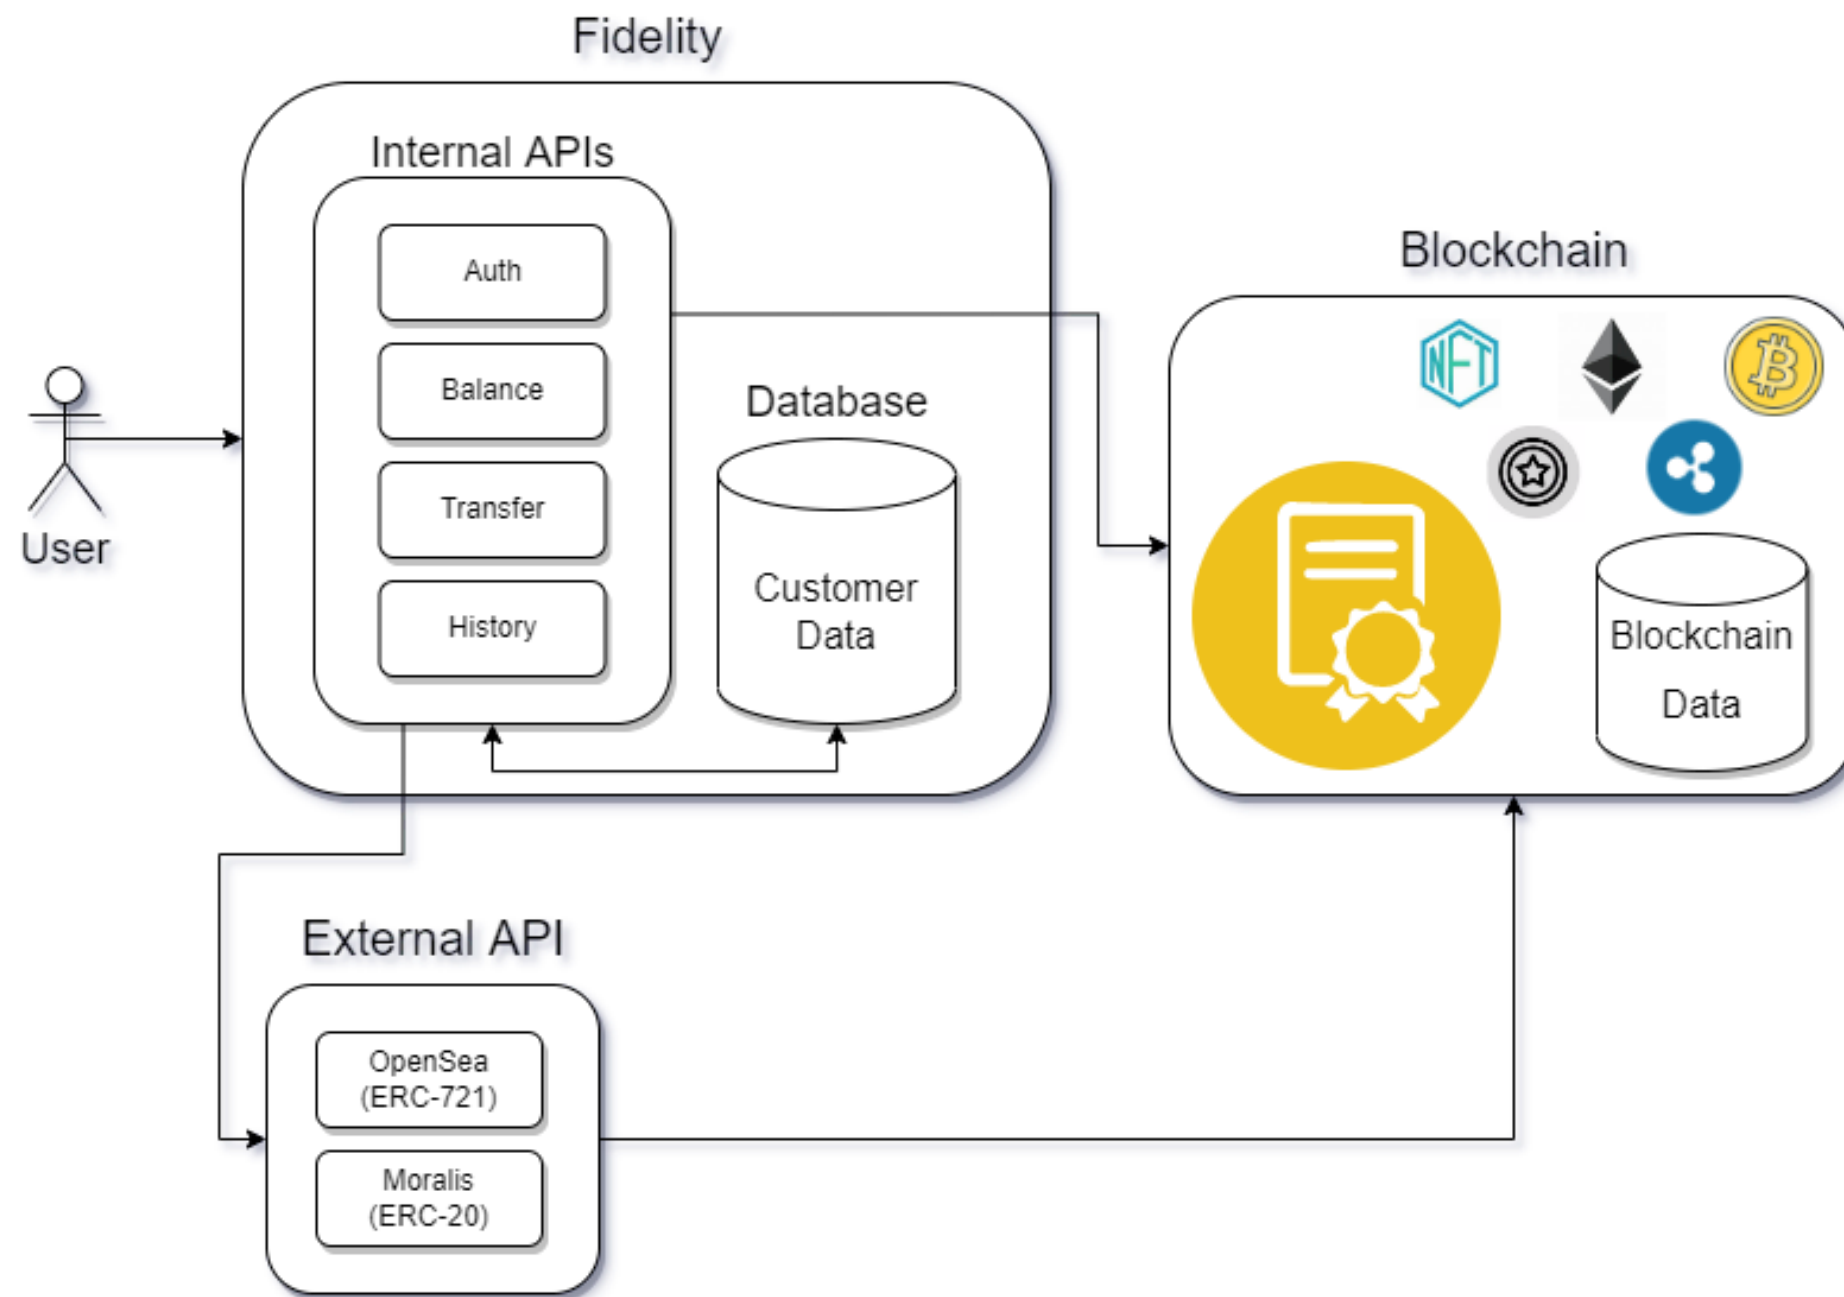

Fetching
transactions Logs

Component Diagram

Our workflow

Front end : React

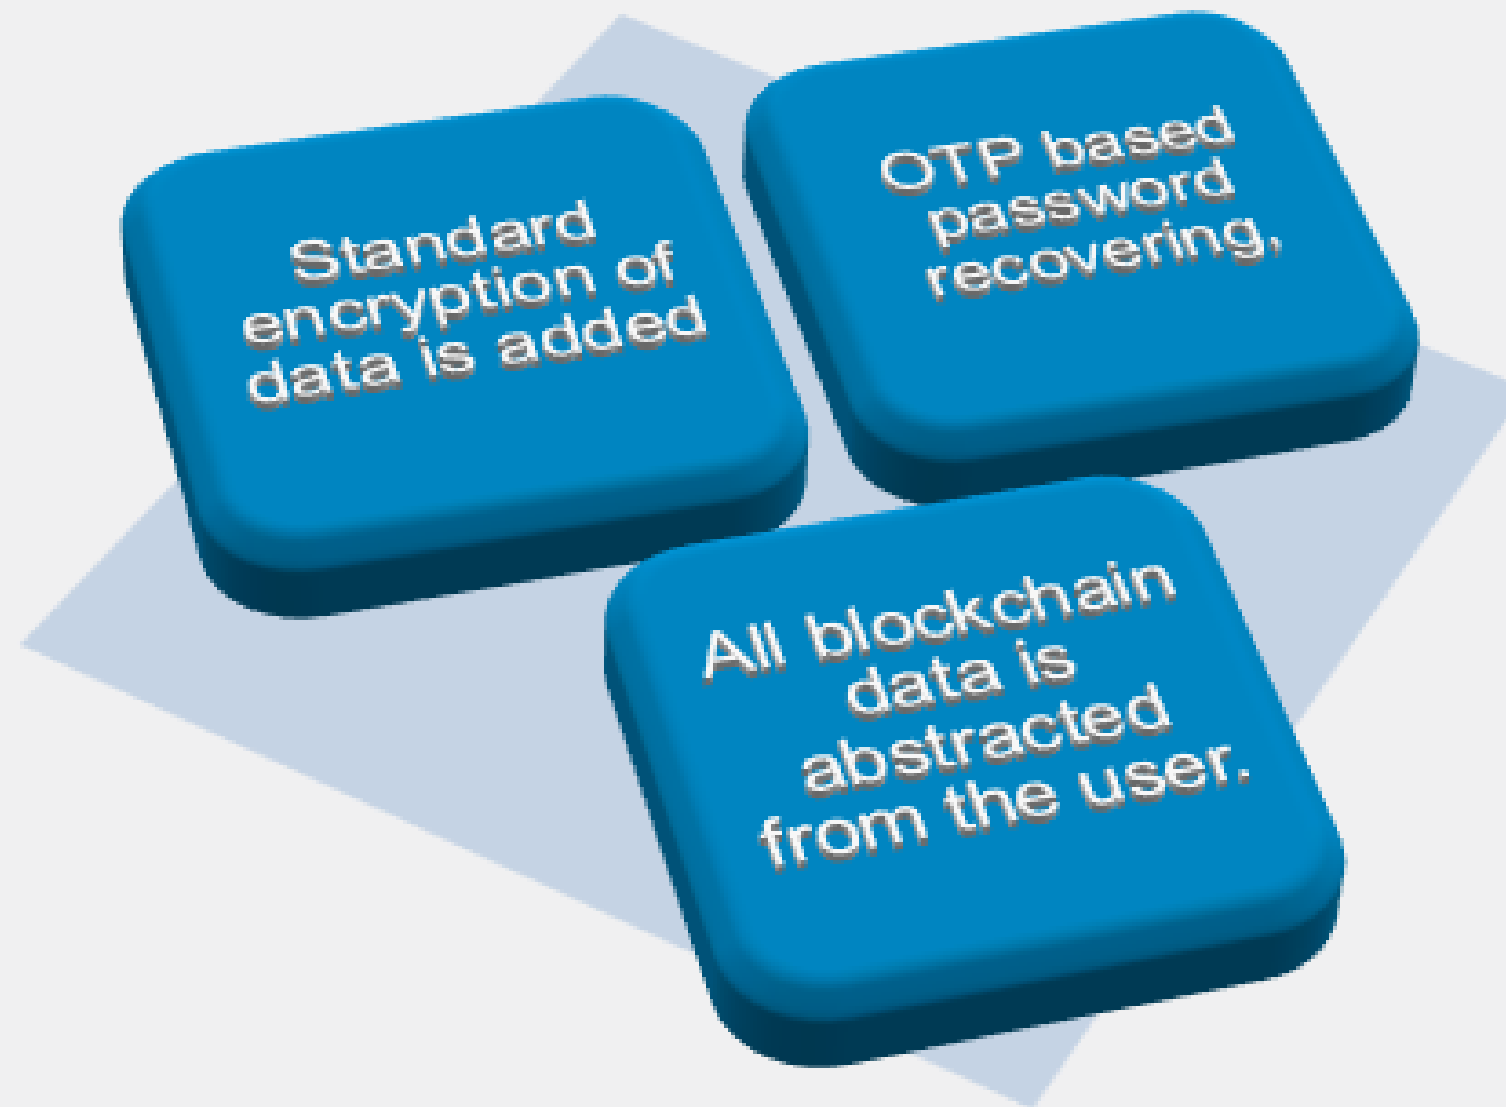

Backend : Flask and Python

API's and SDK's

- **xrpl-py** - The Ripple API
- **bitcoin-lib** - Bitcoin SDK
- **web3** - SDK to interact with blockchain
- **Infura and Etherscan** - Ethereum API
- **Moralis and OpenSea** – Tokens and NFTs
- **Database:** MySQL

Security

Is it safe?

Future scope

What's next?

- Can be integrated with the existing platform.
- Multi-signature wallets can be implemented– Researched.
- Cold wallet functionality for bitcoin and Ethereum.

Challenges

The mountains we overcame

- Anti-Money Laundering checks
- Wallet security
- Bringing down different blockchains to a single platform
- Working with NFTs

Time for the Q&A session
